Herencia Resources

## Excellent results push Herencia Resources' shares higher

Herencia Resources' shares have risen by nearly 7.5 percent today, after the exploration and development company identifying resource opportunities in South America, reported positive metallurgical results from the Paguanta Project, Northern Chile.

Approximately 300kg of metallurgical samples were taken at the 'Patricia' deposit and analysed at the Ammtec laboratory in Perth, Western Australia. The samples were crushed and ground to 38 micron and batch flotation methods used. The final results of the 'locked cycle tests' are now in and as projected, are reported as being "excellent."

Zinc recovery is at 91.6 percent (at 56 percent concentrate grade) and as a bonus, Lead recovery is at 71 percent (at 39 percent concentrate grade) and Silver is at 83.4 percent (combined in zinc and lead concentrate).

Michael Bohm, Executive Director of Herencia was quoted saying "We are extremely pleased with the results of the testwork carried out on samples from the 'Patricia' deposit. The results are excellent and there is scope to optimise concentrate grades and achieve even higher metal recoveries. The high recovery of payable metals will certainly enhance project economics."

Less than a month ago saw Herencia Resources, confirm high grade mineral returns from both the Cathedral and Rosada Veins.
