Herencia Resources

LONDON (Thomson Financial) - Herencia Resources Plc. said its total mineral resource tonnage at its 70 percent owned Paguanta project in northern Chile increased by 26 percent.

The development and exploration company said gold mineralization is also present in the veins, with one metre assays up to 4.59 grams per tonne gold having been returned.

Gold has not been incorporated into the mineral resource estimate at this stage, and therefore, may present significant upside, the company added.

"Despite the currently depressed metal prices, the zinc market is forecasted to recover from 2011 onwards, which should coincide well with any potential start to our production," said executive director, Michael Bohm.
