 **Herencia Resources releases solid results from Paguanta Project in Chile**

Herencia Resources (AIM: HER), the mineral exploration and development company with a primary focus in South America, released further positive drill results from its 70% owned Paguanta zinc-lead-silver project in northern Chile.

Highlights from drilling at the Cathedral Vein included 4.5 metres grading 8.04% Zinc, 1.4% Lead and 74ppm of silver. Other holes returned equally compelling assays, and reaffirmed the potential of Paguanta to Herencia Resources. On the Central Vein, results were as impressive, including 8 metres grading 4.05% Zinc, 2.13% Lead and 122ppm of Silver from diamond drill hole PTDD018. Herencia's drill bit also turned its attention to the newly discovered Rosanda Vein, which runs adjacent to the Camp Vein. Once again, the results were very consistent with the overall drill core data from across the Paguanta Project, with drill hole PTRC058 cutting 8 metres grading 4.6% Zinc, 1.8% Lead and 157ppm of silver.

Herencia is currently carrying out a 10,000 metres diamond and reverse circulation drill program at Patricia, and confirmed today that results to date were positive with high grade intercepts encountered in all veins tested.

The company also noted that visual inspection of recent drill cores identified sulphide mineralisation below the current resource.

Finally, Herencia confirmed that it would commence drilling on the La Rosa Porphyry Copper target in approximately 1 week.

Herencia's Executive Director, Michael Bohm, said:

'The intercepts of mineralisation at depth at Patricia are very encouraging and indicate the high potential of the project. We are pleased to see that the new veins being found are of high grades similar to those encountered in the earlier defined veins.'
